A sense of community

“The TMRP has provided me with many opportunities to meet and work with researchers, including other PhD students, outside of my university. Not only has this widened my research experience beyond my PhD but it has also allowed me to meet and work with experts in this field at a time where networking can be particularly challenging in the virtual world. I have benefitted from training courses and other opportunities.”

“Academics are part of a community who happen to work at a particular institution. Institutional affiliation is only a part of our identity.”

What can a trials methodology network achieve?

- Better, more impactful research
- Less duplication of effort
- Value for money
- Increased knowledge exchange
- Agility - ability to pivot to COVID-19 projects

What have we done?

- Priority setting exercises – referenced in funding applications
- Small project awards (5-20K), unfunded projects, external grants
- Development and maintenance of online resources
- Open webinar series
- *'How to be a good CI', 'How to be a good TSC Chair', 'How to be a good TM'*

Guidance pack

Our overarching aim is Improving Health by Improving Trials. Since its inception in 2009, the HTMR Network has strived to undertake cutting edge research in areas important to trials methodology.

By funding various projects and initiatives, we have contributed to publications, guidance documents, resources and recommendations for trialists. The resources below constitute the current recommended "Guidance Pack"

- COMET: Core Outcome Measures in Effectiveness Trials
- DIRUM: Database of Instruments for Resource Use Measurement
- CONSORT PRO: Patient-Reported Outcomes
- ACE: Adaptive designs CONSORT Extension
- Monitoring trials efficiently: The role of central statistical monitoring

- Guidance
- Workshops
- Webinars
- Working Groups
- Publications

https://www.methodologyhubs.mrc.ac.uk/advice/network-guidance/

- Monitoring trials efficiently: The role of central statistical monitoring
- Sharing participant data: Good practice principles for sharing individual participant data from publicly funded clinical trials
- CONNECT: Consent methods in paediatric emergency and urgent care trials
- MAMS: Some recommendations for multi-arm multi-stage trials
- Qualitative research: Maximising the impact of qualitative research in feasibility studies for randomised controlled trials: guidance for researchers
- Surgical trials: Interventions in randomised controlled trials in surgery: issues to consider during trial design
- PIRRIST: Patient and public Involvement to enhance Recruitment and Retention In Surgical Trials
- SWATS: Online database for Studies Within A Trial (SWAT) and Studies Within A Review (SWAR)
- Doing trials within trials: A qualitative study of stakeholder views on barriers and facilitators to the routine adoption of methodology research in clinical trials

BiGTed Biomarker-guided trial designs (BiGTed):
An online tool to help develop personalised medicine

Background

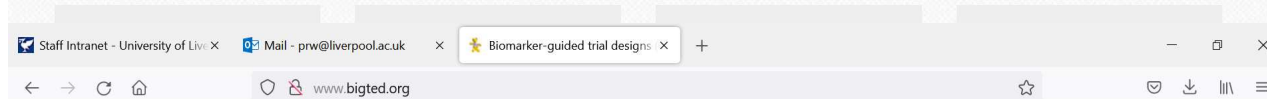

Personalized medicine is a growing area of research which aims to tailor the treatment given to a patient according to one or more personal characteristics. These characteristics can be demographic such as age or gender, or biological such as a genetic or other biomarker.

Prior to utilizing a patient's biomarker information in clinical practice, robust testing in terms of analytical validity, clinical validity and clinical utility is necessary. A number of clinical trial designs have been proposed for testing a biomarker's clinical utility, including Phase II and Phase III clinical trials which aim to test the effectiveness of a biomarker-guided approach to treatment; these designs can be broadly classified into **adaptive** and **non-adaptive**. While adaptive designs allow planned modifications based on accumulating information during a trial, non-adaptive designs are typically simpler but less flexible.

Antoniou et al, as members of the MRC Hubs for Trials Methodology Research's Stratified Medicine Working Group, have undertaken a comprehensive review of biomarker-guided trial designs based on an in-depth search strategy which identified 211 relevant papers, and the results of the review have been published in two separate papers, one focusing on adaptive trial designs and the other on non-adaptive trial designs. On this website, each of the trial designs identified in the review is represented graphically together with an overview of its key characteristics, methodology, and its pros and cons.

Adaptive Designs

Following a literature review we have identified eight distinct biomarker-guided adaptive designs, as follows:

Adaptive Designs

Following a literature review we have identified eight distinct biomarker-guided adaptive designs, as follows:

Adaptive Signature design	Outcome-based adaptive randomization design	Adaptive threshold sample-enrichment design	Adaptive patient enrichment design
Adaptive parallel Simon two-stage design	Multi-arm multi-stage designs	Stratified adaptive design	Tandem two stage design

Non-Adaptive Designs

In the review, five distinct non-adaptive trial designs were identified, as follows:

Single Arm Designs	Enrichment Designs	Randomize-All Designs	Biomarker-Strategy Designs
--------------------	--------------------	-----------------------	----------------------------

Planning – adaptive designs

Costs and staffing resource requirements for adaptive clinical trials: quantitative and qualitative results from the Costing Adaptive Trials project

Nina Wilson¹, Katie Biggs², Sarah Bowden³, Julia Brown⁴, Munyaradzi Dimairo², Laura Flight², Jamie Hall², Anna Hockaday⁴, Thomas Jaki^{5,6}, Rachel Lowe⁷, Caroline Murphy⁸, Philip Pallmann⁷, Mark A. Pilling⁹, Claire Snowdon¹⁰, Matthew R. Sydes¹¹, Sofia S. Villar⁵, Christopher J. Weir¹², Jessica Welburn², Christina Yap¹⁰, Rebecca Maier^{1,13}, Helen Hancock^{1,13} and James M. S. Wason^{1*} 

Abstract

Background: Adaptive designs offer great promise in improving the efficiency and patient-benefit of clinical trials. An important barrier to further increased use is a lack of understanding about which additional resources are required to conduct a high-quality adaptive clinical trial, compared to a traditional fixed design. The Costing Adaptive Trials (CAT) project investigated which additional resources may be required to support adaptive trials.

Conduct – recruitment and retention research

The screenshot shows the ORRCA website homepage. The browser window has two tabs: 'Network Hubs :: Guidance pack' and 'ORRCA :: Home'. The address bar shows 'https://www.orrca.org.uk/#'. The website header features the ORRCA logo and a navigation menu with buttons for 'Home', 'About', 'Search', 'Join the team', 'Ongoing Research', and 'Contact'. The main content area is titled 'Welcome to ORRCA' and includes a paragraph about the project's aim to bring together published and ongoing work in recruitment and retention research. It also mentions updates to the recruitment and retention databases. A 'Search' section displays two statistics: '4,452 Articles in recruitment database' and '1,338 Articles in retention database'. A search bar labeled 'Search studies' is visible below. On the right side, there is a 'Social' section with a 'Follow @ORRCA_rct' button and a tweet from @ORRCA_rct dated Oct 25, 2021. The Windows taskbar at the bottom shows the date as 23/04/2022 and the time as 12:00.

Welcome to ORRCA

The ORRCA project (Online Resource for Research in Clinical triAls) aims to bring together published and ongoing work in the field of recruitment and retention research into searchable databases.

We are still updating the recruitment database with publications from 2018 and 2019 due to the large volume of literature in this field. Articles will be added periodically throughout the review process. An update of the retention database for 2020 and 2021 publications will be starting shortly. Authors are welcome to submit papers as soon as they are published. *Retention database last update: 09/02/2022. Recruitment database last update 31/03/2022*

Frequency and reasons for outcome reporting bias in clinical trials: interviews with trialists

“When I take a look at the data I see what best advances the story, and if you include too much data the reader doesn’t get the actual important message, so sometimes you get data that is either not significant or doesn’t show anything, and so you, we, just didn’t include that”

Abstract

Importance While guidance on statistical principles for clinical trials exists, there is an absence of guidance covering the required content of statistical analysis plans (SAPs) to support transparency and reproducibility.

Objective To develop recommendations for a minimum set of items that should be addressed in SAPs for clinical trials, developed with input from statisticians, previous guideline authors, journal editors, regulators, and funders.

Design Funders and regulators (n=39) of randomized trials were contacted and the literature was searched to identify existing guidance; a survey of current practice was conducted across the network of UK Clinical Research Collaboration-registered
